A NAS (Network Attached Storage) device is a server that is connected directly to your local network and which provides you with a hard disk drive and/or a floppy drive (a case with a removable disk). NAS servers can be as small as a small external hard drive or as large as a network server that is used to back up a wide area network. NAS devices are typically used to provide easy network storage for backup, but may also be used to serve files from the network. Many firms use NASs to back up files or as a media center. A NAS can also be used to save money by reducing the amount of storage space occupied by multiple hard drives that would otherwise be needed for a network server. NAS devices differ greatly in size and function. Besides the standard NAS, the NAS server, the NAS PRO and the NAS Rocket, there are also the NAS HDD, NAS HDD Pro, NAS HDD Lite, NAS Shuttle and NAS Transport. Most NAS HDD drives come in 3 different size ranges such as 2.5", 3.5" and 5". NAS devices can also differ in terms of connectivity and a remote control for the device can be included or not, as well as hardware and software versions. NAS services basically fall into four categories: Network file shares (Simple file sharing) - shares files between computers on your local network. The advantage of this system is that you can share files between multiple workstations within your local network without exposing the files to the Internet. Network folder shares (SMB) - shares folders between computers on your local network. The advantage of this system is that you can share folders between multiple workstations and configure the folder permissions to protect the folders from being accessed. The advantage of this system is that the folder permissions can be edited and applied to individual folders without having to rebuild the shared folders on all the computers. For security reasons, most NASs support a secure folder and file authentication feature, which allows file access only to those computers with the correct authentication. Backup devices (File back-ups) - stores the data from your workstations and removable disks and restores them when needed. Remote access - access to files located on a NAS from any remote computer using a client-server model. The NAS is the server and the remote access client the computer to which you want access. NAS backup devices normally incorporate an internal backup software (which can be a bootable ISO file or a set of files

Howdy, As I'd mentioned there will be some changes in 2.8 version. It will be included to our folder structure, so you will see the view like this: This View is only for users who have 2.7 version installed. For more information, please visit our Page : Thanks for the info, i think everything is going to be fine. Many other users think like me, they can open more than one browser at the same time. I also don't think that adding bookmarks to it is impossible because i don't know how it works under the base. I have been using this software for some time now, and I must say that it is a bit rough around the edges, and the interface could use some updates. However, I am willing to overlook this fact, and I am willing to make a bet that this program is going to be upgraded over the next few years.
