Note Each layer in a Photoshop document has a layer name. To see that name, click the layer in the Layers panel (Figure 10-1). Figure 10-1. You can add as many layers as you want to this document. In the Layers panel, click the little arrow next to the layer's name to see the name. You can also see the layers in the document by clicking the current layer in the Layers panel, as shown here. # The Layers Panel The Layers panel is one of the most important tools for working with layers. For example, the Layers panel is what lets you arrange and rearrange layers so that you can fine-tune the overall image. The Layers panel (Figure 10-1, bottom) has these sections: * **Layer thumbnail**. Click the thumbnail to display a preview of the layer and its contents. (You may need to click the thumbnail twice for it to light up.) The top of the thumbnail has a list of the layer's name, and the bottom of the thumbnail shows the alpha, or transparency, of the layer. * **Layer button**. Click the button to access Layer Properties. The Properties dialog box (Figure 10-2) displays the layer's name, the layer's thumbnail, and the layer's alpha value. * **Arrange**. Click the triangle in the panel's right side to display the Layers palette (Figure 10-3). Here, you can make changes to the _layer order_ in your document—buttons you click to arrange the layers in the order you want. Figure 10-2. Use the Properties dialog box to access layer information such as an image's size and background color. If you want to change a layer's transparency, click a rectangle. This icon is a series of dots that opens the Transparency window. Figure 10

Satoshi Nakamoto's paper outlined how the blockchain would be a means for storing peer-to-peer transactions as digital transactions. The concept of a peer-to-peer network was not new, what was new was the idea that blockchain technology can support the creation of decentralised currencies. To create a peer-to-peer currency, Satoshi Nakamoto used Bitcoin's proof-of-work (POW) algorithm that is a means of creating decentralised currency. The POW algorithm is run on a network of computers that are connected to each other. Each computer in the network makes public records of work in solving cryptographic puzzles, these records are called blocks. The block generation process takes an incredible amount of computing power, which is why the Bitcoin blockchain network has a staggeringly high computing power. The Bitcoin block generation process is so computationally difficult that there will not be another block of Bitcoin from the same computer, and the same computer, for at least 11 years. Once you have solved the puzzle, you are rewarded with 50 Bitcoins, and an encrypted public/private key that allows you to sign transactions with it. Because the POW algorithm is designed to mimic the way in which gold, and other valuable commodities, are mined, it is also known as Bitcoin's mining algorithm. The idea is that there are no central authorities, it is the network itself that solves the cryptographic puzzles, and this process creates new Bitcoin while also rewarding participants for their contribution to the Bitcoin network. Satoshi also implemented the concept of the blockchain. This was a system that records all transactions, which became a focus for Satoshi's second paper. The First Price The price of bitcoin had skyrocketed in the half-year that had followed the announcement of the network. On May 15th, 2010, just a few months after Satoshi released his white paper on the blockchain network, trading had reached $14.99 per Bitcoin. By September 21st, the price of Bitcoin was at $35.95 after the largest transaction in cryptocurrency history was confirmed. The following November the price of Bitcoin reached $90, and by December it was at $182.60. On December 3rd, 2010, Bitcoin's exchange rate reached an all-time high of $266.73. The market capitalization of all Bitcoin in existence at that time was valued at $2.69 billion USD. By July 2011, the price had dropped slightly to $86, but it was in January that the price 05a79cecff

Joe Brooks' research at the Department of Energy's Lawrence Berkeley National Laboratory is changing the way that America moves. Photo: Getty Images. When it comes to "creativity and innovation," the U.S. economy tends to score highest in the developed world, says Joe Brooks, a professor in the Department of Energys' Center for Structural Energy Studies. America's untapped energy storage potential could be key to bringing that score down, he believes. What that potential is depends on how one defines innovation. As part of a working paper released in May, Brooks and his collaborators at Berkeley National Laboratory have zeroed in on a singular factor. "The U.S. has a lot of batteries," he said. The battery industry—which includes the manufacturing of batteries and battery-based components—would be the most innovative industrial sector in the country. "It's rare for energy storage," he said, "but this would be its day." The working paper was titled Batteries Under the Microscope: The Development of the Battery Industry in the U.S. and includes interviews with officials from battery manufacturers and developers, such as SolarCity. In spite of that focus, the paper also includes a broader discussion of other industries that could also boost U.S. innovation. "Innovation's really a product of several factors," Brooks said. "And we haven't looked at the full suite." These include: the composition of the population—such as the distribution of educational attainment and skills among Americans—and education infrastructure, such as the size and concentration of universities and other institutions. Further, innovation depends on the financial sector, which Brooks says is currently under-governed by the federal government. That's also the case for a separate working paper authored by Brooks and his colleagues at Berkeley National Laboratory, which came out last month. "The U.S. has a great regulatory structure, but it's not the best regulatory structure," he said.Q: unable to POST webhook via REST API in Appmaker I'm trying to send a webhook request to my app from a customer.
