How can I use Photoshop for editing? There are a number of different ways to use Photoshop for editing. All photographers have their own preferences, which may or may not be the best tool for editing. My recommendation is to do some research and experiment with various tools in Photoshop to determine what works best for you. Chapter 3 covers blending and layering, so take a look at this topic first. You can use layers to perform basic editing such as outlining or sharpening, or you can manipulate your images using layer masks, which allow you to cut up an image to change individual parts of the image. You can also simply change color and brightness using the eyedropper tool, or you can use adjustments layers that are a collection of plug-ins that allow you to change specific aspects of your image. ## Framing Great Pictures One thing I'll often tell people that they should look at in the frame they've shot is the *_atmosphere_* of the scene. Atmosphere is not just simply a figure of speech; it's the collective visual *_feel_* of a scene. Atmosphere, although it's less obvious than the shadows and highlights, is just as important. ## Capturing atmosphere Atmosphere can be a visual *_feel_* that's communicated through all your senses. It's your eyes, and the way you see a scene. It's your emotions and expectations that an

This tutorial will teach you how to perform all the steps using Photoshop but can also be used with Photoshop Elements. Steps To open any file in Photoshop Elements, you can either click the Open button on the menu bar (Windows users: Alt+O), then navigate to where the file is saved. Or you can right click on the file and choose Open with Photoshop Elements. Useful words Backgrounds You can change the background of any file by clicking the Backgrounds button on the menu bar. You can choose from the following: All Files – The background applied to every layer of the image. The effect will be applied for any size of the image. None – The background will not be applied to any layers. This is useful when you want to use the same background for every element of the image, and it will stay unaltered throughout the editing process. Selected – Only changes the background of the active layer. If the image has a mask applied, only changes the area covered with the mask. You can also choose a color from the Color Sampler which is just what it sounds like. It lets you randomly select from all the colors in the image. Channels and Layers To edit the background of any file, you must edit at least one layer. Each layer represents a different effect or color. Background When you edit a layer, you will need to create a new layer or open a new file. Just click the New Layer button on the Layers palette or choose File > New. New layer button on the Layers palette Layers palette This allows you to change the background to a solid color or a pattern. This is the only way to set a background in Photoshop Elements. When you create a new layer, a new background will be added. You can switch between the active layer and the Background layer by clicking on the eye icon at the top of the Layers palette. This will turn the eye icon blue or red depending on which layer you are working on. This helps you easily switch between the active layer and the Background layer while using the menu bar. Layer Styles There are many different ways to add a style to a layer. In this tutorial, we will explore three of them. The first way is to create a layer style. Q: Use of generic class member in R I try to create a class with generic type to store all of my data, along with numeric, text and date values and i tried to include some example functions to manipulate the data. the main function is: `mlist`
`is(myClass,"myClass") [1] FALSE` > `class(myClass) [1] "list"` So you probably want the `data.frame`: > `myClass`
`is(myClass,"myClass") [1] TRUE` > `class(myClass) [1] "myClass"` Note that you do not need the `data.frame` to store the data as list elements. > `mlist[["dd"]]` [1] "2009-10-10" Note the difference in [] and [. The first is subsetting the list, while the second is subsetting the `data.frame`. You probably want the latter: > `get_value` `get_value(myClass, "dd") [1] "2009-10-10"`

* Windows Vista/Windows 7/Windows 8/Windows 10 * AMD Radeon HD 7850 or higher * Intel Core i3 or higher I understand that this is not a way to reach 0% on a new unlocked handheld. However, I believe that it can be done in the following way. Why? There is the theory that with my chosen methods, I can get myself to at least the following point. 83% = 26,900,000,000 - 3,010,000,000 = 23,900,000,000
