Independence of \mathcal{M}_t on \mathcal{F}_t for probability spaces I have been reading about independence of random processes and I came across a proposition that states that when $X_i(t)$ $\left(i=1,\dots,k\right)$ are independent processes, it is not necessary that $Y_i(t)=X_i(t)$ $\left(i=1,\dots,k\right)$ for \mathcal{F}_t independent random variables on an appropriately chosen probability space. I don't see how to demonstrate this: Example: Let $Y_1(t)=X_1(t)$, $Y_2(t)=X_2(t)-X_1(t)$, $Y_3(t)=X_1(t)-X_2(t)$ and $Y_4(t)=X_2(t)$. It is clear that the first three processes are independent but not that of the last. Since it is not necessary that $Y_i(t)$ $\left(i=1,\dots,4\right)$ coincide with $X_i(t)$, can I conclude that the last isn't independent of the first three? If it is not necessary, why is it so? A: There is no such thing

as "independent of \mathcal{F}_t " for a random process.

Let me re-explain this using your example: Consider a probability space $\Omega = \{0,1\}^{\mathbb{N}}$ and let $\mathcal{F} = \sigma(\{\emptyset\} \cup \{\{0,1\}^n : n \in \mathbb{N}\})$ be the σ -algebra generated by the cylinder sets. Define $X_1: \Omega \rightarrow \mathbb{R}$
