EMDR is available for PSVR for the first time, and is also available for Oculus Rift and HTC Vive for the first time. This is the first in the series of emotional health supplements that Pure Point Games is working on. Pure Point Games is a game development company from Norway, founded by Stian Arne Åheim, Håkon Kornstad, and Bjørn Øksendal. We primarily develop games for mobile, and are also working on a Kickstarter for a new game called "Silent Meals", which is a horror game about food. We are about six people in the company, and the approach we take is to listen to and respect what our users want. We use our own game design studio, which means that we have the chance to help focus and refine an existing game into something better for our audience, and we also have the opportunity to design and develop games from scratch. We often have the opportunity to prototype and test new ideas in VR, and we also have good in-house support and a pool of competent developers. We work with about 5 interns each year, and the biggest part of their work is technical support, development and general bug fixing. We also have some people in the studio doing project management, some project planning, and to some extent creative work. Our studio includes designers, programmers, level and game designers, character artists, business owners and a new media student.Q: How to define an initialization function for a class with mutable default parameters? In class X: class X: def __init__(self, a): self.a = a i was initialize X() by: x = X(1) cannot find a way to use self.a = self.a. A: You can try class X: def __init__(self, a=1): self.a = a This approach is helpful when you don't want to always pass in the value of self.a because you may want it to be a different value. This is not possible with the class body: if you want it to be self.a, you must define it inside __init__. It's not clear to me what the motivation for this is. You could also use a.__init__(a) to supply your default argument

EMDR - EMDR Intro Gameplay: Game "Emdr"- EMDR Gameplay: EMDR - EMDR Full Gameplay:Reading Time: 5 minutes Venezuela is in the throes of a slow-motion food crisis, with hyperinflation and skyrocketing prices rendering many basic foods virtually impossible to find in the country. Some 60 percent of Venezuelans are dependent on aid. To make matters worse, the socialist government is intent on shifting the burden of the severe food shortage onto the population. Nicolas Maduro, the current President of Venezuela, has ordered numerous measures to limit the amount of food available to the public and, ostensibly, maintain the size of his government. The results have been disastrous. The Current Food Crisis The Venezuelan government announced a state of emergency in July 2018 in an effort to address the food crisis, rationing staples such as chicken, milk and eggs. According to the AFP, the initiative has met with "near-unanimous" criticism by the international community as it has been accused of "grave violations of human rights" and of denying Venezuelans access to essential food. RELATED CONTENT: 5,000 People Injured and 51 Detained in Largest Ever Marine Protests in Venezuela The mainstays of Venezuelan culture, including meat, fish and vegetables, as well as important ingredients such as soybean oil, are either unavailable or prohibitively expensive. The price of flour increased tenfold between July and September 2017, according to Reuters. Maduro, who was named president of Venezuela in 2013 by an electoral body stacked with his allies, has attempted to blame the government's own mismanagement for the worsening crisis. "If we don't have more oil, it's not the fault of the corrupt. We are the ones who export food," he said in September, according to Bloomberg. While the situation was once overshadowed by the catastrophe in neighboring nations such as Haiti and Nicaragua, it has been gaining attention in recent months. Reconstruction of Traumas EssayIntroduction and definition EMDR is an acronym for Eye Movement Desensitization and Reprocessing. It was created in the 1980s by Francine Shapiro et al. to treat patients with trauma-related disorders. EMDR is an outpatient psychological approach to treat residual trauma-related disorders, posttraumatic stress (PTSD), and other emotional disorders. It is based on cognitive behavioral theory. The central idea of EMDR is to address past traumatic experiences by means of thought-behaviour therapy, and to allow clients to desensitize and reprocess them with the help of a computerized visual stimulus and instructions. Subsequent memory therapy is another EMDR technique that combines very basic elements of both psychoanalytic and cognitive behavioural therapies. The earliest experience to trigger memory is often a traumatic one. The outcome of the experience in turn determines whether or not it will remain unavailable to consciousness and be processed. If it is unprocessed, it is stored as a dysfunction in the brain functioning. The Memory Different experiences produce different impact on our memory. For example, being the victim of a horrifying experience triggers a shock affect and leaves a traumatic mark on our memory. In some cases, the experience itself has a specific time frame and is associated with a particular time. For example, a rape incident that occurs while the victim is sleeping leaves a deep impact on the victim's memory, at least for a while, because it makes her fear of being attacked while asleep again. In this sense, a certain trauma is retained not just because it is an experience that is not processed. It is processed and tends to retain the imprint of the experience, like an experience that is cut off from our awareness. In some cases, the trauma may get buried to such an extent that it is difficult or almost impossible to see it in a detached form, like, what if the man raping me didn't look like a man. It is not until an experience is recalled, for example, being raped, that the trauma that was not processed recovers its ability to trigger, and the emotional colouring of the experience arises again. After that moment, an individual will be able to see the rape experience as a detached image. It is necessary to distinguish between primary memory and secondary memory. Primary memory is the live one. It presents the essence of an experience, along with its
