Unlock Nokia cell phone with a phone code with.Hvaler IL Hvaler Idrettslag is a Norwegian sports club from Trondheim, founded in 1890. It has sections for association football, Nordic skiing and Nordic combined. The football team currently plays in the Fourth Division, the fourth tier of Norwegian football. Hvaler has previously competed in the third tier of Norwegian football (Norwegian Second Division), as well as in the Norwegian top division (Eliteserien) for the first time in 2010. Their home matches are played at the Valsomstranden Stadium. The club is most notable for having had Harald Eikrem, then one of the world's greatest cross country skiers, as its chairman from 1986 to 1994. His son, Roar Eikrem, was also a notable figure in the world of cross country skiing, and represented Norway at the 1992 Winter Olympics in Albertville. History Hvaler was founded in 1890. The first chairman was elected in 1900 and replaced by Thorvald Soiland in 1923. In 1922 they won the Norwegian Cup, and in 1948 the club won the Southwestern Norwegian Cup. In the early 1960s, Alfred Andersen was Hvaler's most successful chairman

Please ensure that you have a Windows pc or laptop and the latest version of Winimager installed on your pc or laptop. Morphologic and functional effects of occlusion on canine dental pulp. A morphologic and functional study of the tooth pulps of beagles was undertaken during a 2- to 3-week period following anterior maxillary dental procedures. Dental pulp tissue was sampled and classified by cell type and morphologic region. Pulp surface area was determined by computer-assisted image analysis. Anterior maxillary incisors were clipped and retracted, and the distobuccal root of the first molar had a pulpal wall intrusion for 1, 2, or 3 weeks. Pulpal tissue was sampled and processed for light microscopy. Pulp cell classes were identified, and pulp surface areas were measured by planimetry. Pulpal responses were assessed by the presence and location of inflammatory cell infiltrates on the pulpal surface, and by assaying for protease activity. Pulp surface areas decreased significantly 1 week following pulpal incisions and wall intrusions, but returned to control levels by 3 weeks. Subcellular class composition was not altered by incision or intrusion. Cell types with high metabolic potential were present in the 1- and 2-week pulp samples. Pulpal protease activity was less when incisions were
