If you are fluent in English and are interested in our project, please apply on the official website for the localization. # # # Q2Q Q: What is the difference between AR and VR? A: AR and VR are terms used to differentiate between the media types. AR (Augmented Reality) is a type of technology that uses images captured from a virtual camera to superimpose virtual content on a physical place or medium, usually on the real-world display of a smartphone. AR differs from computer-generated graphics because objects are generally based on real-world camera images or videos. The virtual content is layered on top of the real-world environment and interacts with it. AR technology has been popularized by Google's ARCore, a subset of AR, which would mean that you can make 3D models or other 3D-like virtual content go 3D by overlaying virtual objects on the real world. VR, otherwise called Virtual Reality, is a type of technology that uses virtual reality headsets or smartwatches to simulate a virtual space. A virtual reality experience can include any type of sensory experience, such as sights, sounds, smells, and tastes. VR usually involves immersing someone in a virtual world using headsets, such as Oculus Rift, HTC Vive, Sony PS VR, Google Cardboard, etc. VR is still in its early stages and still has many kinks to work out. Q: What languages are you supporting? A: We are looking for translators to help with the English localization of our game. Q: How can I

**Experiments were designed to study the role of urinary kallikrein in blood pressure, blood flow and renal function. Acute experiments were performed to provide a direct evidence for kallikrein. Plasma kallikrein activity was determined using L-783, a kallikrein substrate. Chronic experiments were designed to observe the effect of a new selective kallikrein inhibitor, L-786-197, on the changes in the levels of blood pressure, blood flow and urinary sodium excretion. As for effects of L-783, acute intravenous injection of L-783 produced a decrease in blood pressure and increase in cardiac output. Next, L-783 was injected subcutaneously in order to prevent the disappearance of the effect of L-783 and to determine the relative contribution of kallikrein to the observed changes. Intravenous injection of L-783 produced no significant change in blood pressure but an increase in cardiac output and a decrease in renal vascular resistance. These effects were blocked**
