channel.Q: Possible to have identical row heights between two tables I have two tables, which are identical except for one column, and I want both tables to have the same row height. I have been able to achieve this in Chrome, but not in Safari. It seems to be a

layer issue, since both WebKit browsers have the same bugs. Take the following html as an example: row 1row 2 In Chrome, both rows have the same height. In Safari, the second row has a different height than the first row. The first row is completely empty (both in the

attribute and in the HTML), as is the second row. I have tried fiddling with the CSS for all three tables to try to get this to work, but no luck yet. Am I missing something?
A: Safari issue here should be fixed, at least in Safari 6. See bug report: Q: Counting the number of

monochromatic triangles in a square My father told me this problem (which I suspect isn't unique to our family) but here it is anyway: In how many ways can you color the interior of a 4×4 square black and white such that the four corners are monochromatic? The

problem answers (without proof) that the solution is: $$n!\sum_{\alpha=0}^{1}(-1)^{1-\alpha}\binom{n-\alpha}{2},$$ where n is the total number of black pixels. He claims that 0 is the only way to achieve a 1×1 monochromatic

4×4 square, and the $4!$ permutations represent the other three. I am skeptical of both claims. I recall a similar problem at Calc 3 and I recall the solution being based on a comb
