Despite the absolute decline in androgen secretion with aging in both men and women, there is no general consensus whether or not endogenous androgens are important for male and female aging. The most critical component of this controversy is whether androgens affect life span independently of body fat. There are several possible reasons for these disparate results. For example, the differences in the sources of data that were used to establish the relationship between androgens and aging might be critical. Another possibility is that the age of the population that was studied might be critical. The third possibility is that the relationship of androgens with aging might be different between men and women, because the androgen levels used to examine this question are so different. In conclusion, there is no doubt that androgens play a role in the aging process, but the mechanisms are not yet clear.After the excitement of today, another fan event has come and gone, and what better way to end the week than with our exclusive VIP event with Digipen, and our next installment of How It Works.
