Keyboard Macro recorder, that allows you to make repeatable key combinations on your keyboard.

Description: Macros are, generally speaking, tasks of keystrokes that repeat when they are executed. While a macro can be used to perform a variety of operations, the most common uses are formatting and text replacement. The main goal of macros is to save time and work, but they can also reduce errors and help improve typing speed and accuracy. Watching macros in action on YouTube is pretty rare, as they are very easy to create. On the contrary, using one can be a lot more difficult, because if you don't know exactly what you're looking for, you might find it hard to find. The latter is the case of KeyMacro, an application that's designed to help you build and record your macros, without the need to go through lengthy procedures to get started. Once installed, KeyMacro runs in the system tray area, with all its actions occurring with a simple right click. To make your life easier, the application will even show you some basic tips on what the selected keystroke means and where it is located in the keyboard. If you prefer, it's also possible to choose between a traditional macro button or a "dynamically defined" one, with each area allowing for a certain number of recordings. When you select a macro, you'll see its description and a preview of the keystrokes performed. You can select which of them you want to insert in the active document, adjust parameters like word and sentence spacing, set the tab to spaces or tabs, and edit the recording duration. An important note is that KeyMacro doesn't provide any sort of editing feature, so you'll need to use a different application to get your desired result. In order to save a macro for the future, click on "Save", and you'll see a preview of the document ready to go. You can even save the macros to a portable application and use them on different computers. In conclusion Considering that KeyMacro is specifically designed to create and save macros, it shouldn't be necessary to add too much to the review. It does exactly what it's supposed to, while the included features are basic enough to get the job done. Tiny SyS Bar is an application designed to help you monitor and control your computer in real time. It does not alter your Windows registry. Description: Yet another piece of software that helps to manage

resources, Tiny Sys Bar lets you keep a close eye on all CPU and memory consumption. Main features: - Add a system monitor to your desktop - Automatically display CPU and RAM usage in real-time - Hide or display network devices - Display the number of running processes - Watch out for processes with excessive resource usage - Never miss any changes - Display system information, including processor and memory type

Tiny Sys Bar offers a slick and light interface, with a single toolbar on the desktop. It's really easy to bring up for a minute and keep an eye on the process. However, the application is designed to show a number of system details, which aren't always that interesting. Apart from that, there's no way to control its functionality or display settings. Moreover, the settings menu doesn't offer any sort of information about the program itself, which might help you decide if it would be the best choice for you. The sidebar on the desktop is where the real action happens. It's divided into two sections: Applications, where the name of each running process is displayed in a tooltip, and Details, which offers a full-screen overview of the active devices on the network. The only problem here is that the number of displayed items is pretty much limited, with the number of network devices displayed per line being four. In order to start the application, you need to download the .NET Framework, which needs to be installed separately. In conclusion As previously mentioned, Tiny Sys Bar is not a pro-level tool, which offers a few extra features over a simple calculator. Its main purpose is to help you see CPU and memory usage, network devices, and the number of running processes in real-time, so you can choose to display that info.

Description: The programs which tend to use the most CPU power and memory are the ones that might make your computer run slow or even crash, so it's always a good idea to keep an eye on them. Tiny Sys Bar helps you do exactly that, displaying CPU and memory usage as well as network traffic per time interval. Main features: - Add a system monitor to your desktop - Automatically display CPU and RAM usage in real-time - Hide or display network devices - Display the number of running processes - Watch out for processes with excessive resource usage - Never miss any changes - Display system information, including processor and memory type

This application is divided into two sections. The sidebar on the desktop displays a number of system items, such as
