The new window types include Grid, Aspect, and Constrained. The Grid window enables you to create a grid of images, stacked or horizontally. The Aspect window enables you to easily change how your images will be displayed. This new window type mimics Live Photos from the iPhone 7. The Constrained window is a great fit for those who want the image size (or resolution) that they are working with to be restricted. Changing your document and web view operations is done through the new Tools menu. The new view options are "Main," "Slide," and "List." The "Main" view is the default view. "Slide" is similar to a slide show, while "List" is best suited for viewing just one or a few images. Just about everything works the same in terms of image display, placement, and operations. Do note that you need to toggle with "Shift" + left click on images to open the selection handles for resizing them. One of the most important changes is that Photoshop CS5 enables you to only use Unsharp Mask for black and white. This is a critical change from the CS4 version, as the inclusion of Unsharp Mask was a very useful feature. New in the software update is the Unsharp Mask Settings window, which enables you to easily and quickly set the Unsharp Mask radius and direction. The Radial Blur can be set just as easily. The Colors front is improved in Lightroom / Photoshop by the addition of a previews window. It enables you to see how the color of your image will look with other selected gradients and other color accentuated objects. The Color Balance panel in the basic palettes also receives an upgrade to a more useful and feature-packed view. This new view is more similar to the curves and exposure panel. However, it is no longer divided into the basic categories of Blue, Red, Green, and Yellow.

This best-of-breed approach to collaboration requires careful planning and can be disruptive. It can also be very time-consuming, especially if a project involves a lot of images and complex layers. Adobe Share for Review solves this problem with efficiency and scalability. It easily scales to any number of designers, and provides a fully featured, protected versioning system for designers, developers and any other members of the project. Users can continue to use Photoshop for editing, as usual. The only difference is that when they save a file in a project, that entire project file is saved and is now available to all collaborators. Designers can keep working while editors review files. Editors can continue to upload images to their accounts, approve and send approved changes back to the main project. It is especially useful for turning a Photoshop file into a collaborative project that can be shared with and tracked by multiple designers and developers. This will become even more important as Photoshop CS5 is integrated with mobile devices; designers can work everywhere, and use Photoshop to collaborate on projects. As projects grow, it is important to have a file versioning system that allows designers to keep working while seeing what other team members are working on. Collaborators can view, import and approve files by adding comments and rating

changes in the status bar. Changes are sent to images to link them to files and indicate whether a version of a file is approved or rejected.
