Wireless communication networks are commonly employed to provide voice and data communication to subscribers. Such networks may be designed to comply with a particular standard, for example, the standard defined by the Telecommunications Industry Association (TIA), the standard defined by the European Telecommunication Standard Institute (ETSI), or similar international or national standards. For example, the Universal Mobile Telecommunications System (UMTS) is specified in ETSI TS 125.1, the 3rd Generation Partnership Project (3GPP) long term evolution (LTE) is specified in 3GPP TS 36.300, and the Global System for Mobile Communications (GSM) is specified in ETSI TS 08.18. All of these specifications are hereby incorporated by reference. In a wireless communication system, a base station communicates with one or more mobile stations. Typically, the base station and mobile stations communicate with each other over a radio frequency (RF) air interface using electromagnetic waves in accordance with one of several established wireless protocols. These wireless protocols include 1xEV-DO (Evolution Data Optimized), 1xEV-DV (Evolution Data/Voice), 1xEV-DO Rev. A, and 1xEV-DO Rev. B. The protocols differ from each other in at least some aspects, including modulation techniques and information rates. For example, 1xEV-DO Rev. A is backwards compatible with 1xEV-DO Rev. 0, whereas 1xEV-DO Rev. B is not backwards compatible with 1xEV-DO Rev. 0. Typically, there is a limited
